Presentation Overview

Overview Non-technical overview of LEGO©MINDSTORMS©NXT from a community and user standpoint

HW and SW Description of NXT hardware and software from a developer perspective

Examples (1) Using TinyOS as a firmware,
(2) an intelligent algorithm

Q & A There will be time for discussion and future research ideas

Lab Drawing for the NXT 2.0 and lab exercise using it

Note 1: LEGO has sponsored a NXT 2.0 kit

Note 2: LEGO® , MINDSTORMS® are trademarks of LEGO® .
The tutorial contains pictures from Atmel ARM7 documentation, and from LEGO documentation.

Note 3: There is additional material included: Many slides are supplementary and included for future reference.

NXT Software

Debugging NXT

- How the open source universe around Lego Mindstorms NXT is structured
- Talk about a world that stretches from high-schools to adults and from building bricks to programming in assembler
- Emphasis on the overview and the programming aspects
- Participants will be able to see where in the NXT programming spectrum their interest match most
- Use the tutorial to get started with open source programming on NXT

Debugging NXT

- Description of open source hardware and software
- LEGO business models are discussed
- The old RCX
- NXT in several (online) communities
- Overview of how NXT can be programmed in different environments

Some Mindstorms History

- 10 years since Mindstorms was released
- First LEGO Mindstorms was the LEGO RCX: Successful
- LEGO intended it to be a closed source product, but...
- It was soon hacked:-)
- The open source strategy was pursued even more with the present LEGO Mindstorms
- A Goldplated NXT and a limited edition Black NXT was produced in relation to the 10 year anniversary

[Debugging NXT](#)

- Development of NXT started in the 2004
- Initial group was Ralph, Steven, John, and David
- First prototypes were circulated on a limited number basis inside the current MUP group and a select few outside that group
- MUP: Jan 2006, 5 people
- MUP II: Nov. 2005, 11 people
- MDP: 2006
- MCP 2: 31 persons, 100 chosen from 10000 applicants
- MCP 3: 2008-2009
- MCP 4: Next slide

LEGO Design Routines

- Lego has a group of people who has the privilege of talking directly to LEGO staff
- Under non-disclosure agreements (NDA)
- First group of MCPs (MUP) were a select group
- Used as a sounding board for the ideas that went into developing the first LEGO MINDSTORMS NXT.
- MCP 4 is commencing as we speak

Outline

Firmware

Programming

ARM7

NXT Software

Debugging NXT

- Lego has a website for educational activities
- Strong focus on university segment
- LEGO MINDSTORMS NXT comes in educational sets
- Rechargeable battery and extra building pieces
- Sold with site licences that accompany the NXT
- Different sales curve from retail (slow start, longer product life)

[Outline](#)

- MINDSTORMS community is large and diverse
- Blogs, forums, large events, books, the MCP program and more
- NXTStep and the NXTasy blogs
- Lugnet is a large LEGO fanclub

The screenshot shows the website nxtasy.org with a navigation bar (Home, Forums, Repository, Challenge, About) and a sidebar with sections for Editor-in-Chief (Guy Zin), Creator (Eric Salinas), and Contributors (Dave Atchley, Louis Bhorf, Claude Baumann, Daniele Benedettelli, Rachel Delorme, Rod Gilles, John Harves, Joshua Henzl, Adam Parkes, Kasper Olsen-Pedersen, Mac Pajo, Eric Salinas, Tander Solleed, Dick Swan, Paul Tinger, Simon Tulevik, Guy Zin). A search bar is also present.

September 14th, 2009

LEGO MINDSTORMS NXT installation on Snow Leopard

There have been a number of reports that a fresh instal of the LEGO MINDSTORMS NXT software on Snow Leopard (Mac OS 10.6) fails. From LEGO support comes the following instructions for a work around:

"Copy all files from the Mindstorms CD to a folder on your desktop. Open that folder and look under "Parts". Locate MindstormsIcuEdu.pkg or MindstormsIcuFat.pkg. Right-click and choose "Show Package Contents". Navigate into the Contents/Resources directory and delete the "preflight" file. Close this package and run the meta-package from the [folder on your] desktop to install Mindstorms NXT."

Schools

- Many schools participate in First LEGO League
- A tournament where current theme is played out
- The idea is to have adults lead or mentor a team of children aged 9-14 (16 outside the US)
- NXT is used to complete a challenge put out by the FLL management

Introduction

Open Source

Sensors

Inside NXT C 101

Firmware
Programming

ARM7

NXT Software

Debugging NXT

- LEGO earns money on NXT by selling the kit itself
- Licences to educational institutions are also revenue source
- First version of LEGO MINDSTORMS NXT was released in the beginning of 2007
- A second version appeared in the fall of 2009 (biannual release schedule:-)?
- NXT 2.0 is shipped with a different set of standard sensors (color sensor)
- Spring releases at toys fairs which is then ready for Christmas sale

[Outline](#)

[ARM7](#)

[NXT Software](#)

[Debugging NXT](#)

- LEGO partly produce and package NXT on their factory in Billund
- Staff around NXT development is not big
- Firmware development team is in control of the software development
- National Instruments (NI) designs the NXT-G environment
- The careful selection of close partners makes for long-time stability

Outline

Open Source

Sensors

Inside NXT C 101

Firmware
Programming

ARM7

NXT Software

Debugging NXT

- NXT is a complex product compared to other LEGO products
- Requires focus on quality
- Updated versions released on the official MINDSTORMS website (<http://mindstorms.lego.com>)
- First firmware had the version number 1.1 (or 1.0...) and the current released version for NXT 2.0 is versioned 1.28

Partners

- Many institutions, companies, groups, and individuals have a stake in NXT
- National Instruments is presumably the most important
- MIT, Tuft, Carnigie Mellon, and others are also active
- Others such as *nxtprograms*
- Number of large events
- This includes `Brickfest`
- There has also been a MINDSTORMS NXT Sumo Competition

NXT Alternatives

- NXT is not completely alone...
- Sun Spots from Sun/Oracle
- Fisher-Technic offers a new robot controller which is based on an ARM9 processor running at 200MHz
- Various evaluation kits: mbed, IAR, etc.
- However, it is difficult to match dealer network, community, and history of LEGO

[ARM7](#)

[NXT Software](#)

[Debugging NXT](#)

- NXT features both analogue and digital interfaces to its sensors.
- Sensors are based on an analogue to digital conversion
- Signals are fed into the ARM processor for further processing
- Digital sensors are made with an I2C compliant protocol
- I2C is a two wire protocol that allows for a number of devices on the shared bus
- It can be monitored with a logical probe

[ARM7](#)

[NXT Software](#)

[Debugging NXT](#)

- LEGO MINDSTORMS NXT comes with an open source operating system
- Operating system is written in ANSI C
- Source code fundamentally access the physical layer such as input and output ports of the ARM processor
- Another part provides an abstraction layer to these services (Show the HPL, HAL files...)
- Operating system is a traditional round robin scheduler
- Services each a number of modules

Custom Sensors

- It is possible to create custom sensors
- EAGLE is a CAD program for creating specialized PCBs
- The PCBs can be fabricated at places such as Olimex.
- Olimex accepts EAGLE files (probably easier than Gerber files)
- Sensors can be prototyped for under \$50

NXT Firmware

- NXT actually consists of two different firmwares
- The main firmware controls the interaction with the user, and radio communication to other NXTs
- An ATmega48 generates the pulse width modulation (PWM) signals for the three motors
- It also provides input regarding the state of the push buttons on the NXT
- Host side SDK which allows for interaction with the NXT via a DLL

Firmware Replacements

- A growing number of firmware replacements available
- Examples: lejos, NQC, pbLua, and RobotC
- A different example is TinyOS
- *leJOS* is based on a small virtual Java machine. It is a firmware replacement that allows for Java programming on Lego Mindstorms NXT. There is extensive support in forms of tutorials, well-developed APIs, and Netbeans/Eclipse programming IDEs at the leJOS website.
- Lua is a scripting language (see Lua website). It is said to perform faster than other scripting languages. Ralph Hempel has ported Lua to Lego Mindstorms NXT and labeled it *pbLua*
- *Not eXactly C* (NXC) is language similar to C. It is supported on Lego Mindstorms NXT by John C. Hansen and available from <http://bricxcc.sourceforge.net/nbc/>. It is built on top of the *Next Byte Codes* (NBC) compiler. It is a firmware replacement.

NXT Software

Debugging NXT

- Changes needed to make the source code compile with an arm-elf based GCC
- See details in `ConvertNxtGcc.java` program
- First versions of NXTGCC were error-prone
- IAR supports, and Lego uses, nested flexible array members
- GCC does not support this
- Key was to change the nested flexible array to become a fixed size nested array

Debugging NXT

- Characterized by a number of modes, exception types, and interrupts
- Associated with each mode is a current program status register (CPSR)
- Each exception and interrupt type is associated with a priority
- 6 privileged modes named `system`, `svc`, `abort`, `fast interrupt`, `interrupt`, and `undefined mode`
- They can all modify the CPSR
- The unprivileged user mode cannot modify the CPSR

Features

- Incorporates the ARM7TDMI[®] ARM[®] Thumb[®] Processor
 - High-performance 32-bit RISC Architecture
 - High-density 16-bit Instruction Set
 - Leader in MIPS/Watt
 - EmbeddedICE™ In-circuit Emulation, Debug Communication Channel Support
- Internal High-speed Flash
 - 512 Kbytes (AT91SAM7S512) Organized in Two Contiguous Banks of 1024 Pages of 256 Bytes (Dual Plane)
 - 256 kbytes(AT91SAM7S256) Organized in 1024 Pages of 256 Bytes (Single Plane)
 - 128 Kbytes (AT91SAM7S128) Organized in 512 Pages of 256 Bytes (Single Plane)
 - 64 Kbytes (AT91SAM7S64) Organized in 512 Pages of 128 Bytes (Single Plane)
 - 32 Kbytes (AT91SAM7S321/32) Organized in 256 Pages of 128 Bytes (Single Plane)
 - Single Cycle Access at Up to 30 MHz in Worst Case Conditions
 - Prefetch Buffer Optimizing Thumb Instruction Execution at Maximum Speed
 - Page Programming Time: 6 ms, Including Page Auto-erase, Full Erase Time: 15 ms
 - 10,000 Write Cycles, 10-year Data Retention Capability, Sector Lock Capabilities, Flash Security Bit
 - Fast Flash Programming Interface for High Volume Production
- Internal High-speed SRAM, Single-cycle Access at Maximum Speed
 - 64 kbytes (AT91SAM7S512/256)
 - 32 kbytes (AT91SAM7S128)
 - 16 kbytes (AT91SAM7S64)
 - 8 kbytes (AT91SAM7S321/32)
- Memory Controller (MC)
 - Embedded Flash Controller, Abort Status and Misalignment Detection
- Reset Controller (RSTC)

Periodical Interval Timer

The PIT timer generates the system tick.

AT91SAM7S Series Preliminary

16. Periodic Interval Timer (PIT)

16.1 Overview

The Periodic Interval Timer (PIT) provides the operating system's scheduler interrupt. It is designed to offer maximum accuracy and efficient management, even for systems with long response time.

AT91SAM7S Series Preliminary

19. Memory Controller (MC)

19.1 Overview

The Memory Controller (MC) manages the ASB bus and controls accesses requested by the masters, typically the ARM7TDMI processor and the Peripheral DMA Controller. It features a simple bus arbiter, an address decoder, an abort status, a misalignment detector and an Embedded Flash Controller.

JTAG, Thumb, ARM

7. Processor and Architecture

7.1 ARM7TDMI Processor

- RISC processor based on ARMv4T Von Neumann architecture
 - Runs at up to 55 MHz, providing 0.9 MIPS/MHz
- Two instruction sets
 - ARM® high-performance 32-bit instruction set
 - Thumb® high code density 16-bit instruction set
- Three-stage pipeline architecture
 - Instruction Fetch (F)
 - Instruction Decode (D)
 - Execute (E)

7.2 Debug and Test Features

- Integrated EmbeddedICE™ (embedded in-circuit emulator)
 - Two watchpoint units
 - Test access port accessible through a JTAG protocol
 - Debug communication channel
- Debug Unit
 - Two-pin UART
 - Debug communication channel interrupt handling
 - Chip ID Register
- IEEE1149.1 JTAG Boundary-scan on all digital pins

Debugging NXT

- The CPSR defines the characteristics of the current mode
- It can mask (ie. not allow) interrupts and fast interrupts
- The CPSR includes a flag whether the ARM7 is executing thumb code or arm code
- There is a register file which includes 37 registers
- Each register is 32 bit wide
- Each mode uses 17 registers
- Registers R0-R12 are shared between `usr`, `sys`, `svc`, `abt`, `irq`, and `und` modes
- The `fiq` mode has its own banked version of the R8-R12 registers
- All modes have their own stack pointer and link/return pointer: R13 and R14
- The program counter, `pc`, is placed in R15

Memory Layout and Dynamics

- Flash memory is initially mapped to address 0x0000 0000
- Flash is also accessible at address 0x0010 0000
- NXT immediately branches to the reset handler that is defined in CStartup.S
- It uses a temporary stack in the RAM area
- The reset handler sets up the stacks for the interrupt handler (IRQ), the undefined instruction handler (UND) stack, and the user stack (USR)
- The USR stack is used when the normal code executes
- IRQ stack is obviously used when the IRQ handler is invoked: it branches to the correct interrupt service routine (ISR)
- Controlled by writing the address of that ISR into the advanced interrupt controller (AIC) source vector register (SVR)
- Example: each of the three timers (TC0, TC1, TC2) have an ID, and that ID is used as index in the AIC SVR vector

Next: Memory Layout

Undefined Instruction Stack Setup

- Undefined stack setup in Cstartup.S
- The illegal memory access (ABT) stack is set up before the undefined instruction stack

```
/* Set up Undefined Instruction Mode
   and set UND Mode Stack*/
.EQU UND_STACK_TOP, (ABT_STACK_TOP - ABT_STACK_SIZE)
msr    CPSR_c, #ARM_MODE_UND | I_BIT | F_BIT
mov    sp, r0 /* Init stack UND */
sub    r0, r0, #UND_STACK_SIZE
```

[Outline](#)[Aim of Tutorial](#)[Introduction](#)[Open Source](#)[Sensors](#)[Inside NXT C 101](#)[Firmware
Programming](#)[ARM7](#)[NXT Software](#)[Debugging NXT](#)

- Remapping of address 0x0000 0000 such that it is now the RAM and not the flash that is accessible from address 0x0000 0000
- Main reason for this is that we need to service interrupts even when the NXT flash-based file system is being written to
- Remapping the memory ensures that the interrupt vector table is access in RAM
- All interrupt service routines are linked into the .fastrun segment

Show segments in file.

NXT Modules

Scheduler This is the main scheduler: `m_sched`. It works in a round robin fashion with a 1 ms system *tick*. It will call each of the modules listed below using function pointers. There is an initialization phase in which each module's `clnit` method is called. Then the system starts calling the `cCtrl` methods. Termination is done via calls to `CExit`.

Button It handles the four buttons on top of NXT. Principle: It uses the AD converter peripheral. Button 0 is read as? Button 1-3 is read as an AD converted value.

CMD This is the Lego virtual machine. It reads the executable files stored in flash and creates a RAM space for runtime information. The `rx` file contains bytecode instructions, bytecode scheduling, and run-time data.

Comm It takes care of the BT, USB and the Highspeed port. Peripherals used: SPI to BT, USB, and USART in RS485 mode.

NXT Modules

Display It is code for accessing the pixels of the 100 x 64 pixel display. It is possible to both set pixels, write characters, and strings (it is a matter of abstraction). There is a font included with the NXT. There are eight text lines on the display. It accesses the serial peripheral interface (SPI) hardware peripheral. The SPI works by writing data to a slave (the display in this case) over the master out slave in (MOSI) line. It receives data from the slave over the master in slave out line (MISO). The data flow is synchronous and is regulated by a serial clock (SPCK) line. The display receives a command from the ARM7 specifying which line is to be written, and then it receives the actual data for that line.

Input The input sensors are plugged into the 4 input ports on NXT. NXT will know which type of sensor is plugged into a port. It can be a temperature sensor, sound, lowspeed, and so on. The lowspeed sensor is an I2C/TWI compliant sensor.

NXT Modules

IOCtrl This module controls the booting and power down sequences of NXT. It will write to the AVR what the power should be and what the PWM for the motors should be. The IOCtrl module uses the I2C(TWI) hardware peripheral to relay this information to the AVR. It also uses the advanced interrupt controller (AIC), by having it call an I2C handler routine.

Loader File management is achieved by the loader module. It reads, writes, creates, and deletes files in the NXT flash. It resides in the upper part of the flash memory starting from the value of the memory address STARTOFUSERFLASH in d_loader.h. It uses the memory controller (MC) peripheral module of the ARM7. No read while writing: the methods that perform erase and write of flash pages are placed in RAM. This is achieved by marking the methods with __ramfunc, which tags the method to belong to a section called .fastrun. The .fastrun section are placed in the DATA=RAM area.

NXT Modules

Lowspeed An I2C compliant device can be connected to one of the four input ports. The lowspeed module handles the communication and recognizes the connected sensor as either the standard ultrasonic device, or a custom device. It uses an IRQ handler that is invoked via the AIC hardware peripheral: It utilizes the pulse width modulation controller (PWM) peripheral to generate the clock.

Output Motors are connected to NXT through the three output ports: A, B, and C. The module communicates the motor output to the AVR via the I2C bridge. It is managed by struct, which is passed to the AVR from the ARM7 that controls this communication line. The information that controls the motors are an output mode and a PWM frequency for each motor. Thus, the output module make use of the hardware peripherals TC0, TC1, TC2, to monitor motor C, A, and B respectively. Interrupt handlers: the tacho count bookkeeping.

NXT Modules

Sound A loudspeaker with 8 bit resolution is controlled by the sound module. It plays sounds which are files residing in the NXT file system. Each time cCtrl method of the sound module is called, then it either plays a sound, continues to play a sound, or closes the sound file that has been played. The module utilizes the synchronous serial controller (SSC) hardware peripheral. With the SCC providing the AC signal ((SOUND_ARMA from PA17) to the SPY0030A audio driver, NXT can play sounds. It uses the peripheral DMA controller (PDC) to handle the transmission of the bitstream to the speaker.

UI The module manages the menu system, selected files, icons, animations, etc. on NXT. It responds when an user press on of the buttons on NXT.

Timer NXT is programmed around a system tick of 1 ms. This property is supported by the timer module that use the periodic interval timer (PIT) hardware peripheral to maintain a 1 ms counter.

Reading the compilation statistics in Eclipse

Comparison of GCC and IAR Code Size

Compiler	Packing structs	Size of .text (bytes)	Size of .data (bytes)
GCC	All	202052	54548
NXTGCC	Selected	180104	54144
GCC	None	162136	54228
IAR	(speed)	127552	49831
IAR	(size)	122440	49763

GCC compiler (arm-elf-gcc version 4.2.2) that NXTGCC uses, creates a larger code footprint than the IAR compiler does. For the flash we can compare the GCC compiler's approx. 175 KB to the IAR compiler's approx. 120 KB. Regarding RAM, the picture is approx. 53 KB compared to approx. 49 KB in favor of IAR.

Programming](#)[ARM7](#)[NXT Software](#)[Debugging NXT](#)

Lego, Atmel, and the NXTGCC project provide comprehensive information about NXT. This includes hardware schematics, explanation of important protocols, and documentation for programming NXT:

- **Lego:** Hardware Developer Kit
- **Lego:** Software Developer Kit
- **Atmel:** AT91SAM7S256 aka ARM7 hardware description
- **NXTGCC** <http://nxtgcc.sourceforge.net>
